The tables on the following pages provide all of the significant intervals for all of the assays received at Castelo de Sonhos through February 21st, 2020 above a 0.3 g/t cutoff (close to the marginal cutoff for an open-pit project at current costs and prices).

X, Y and Z coordinates of the hole collars are in UTM coordinates.

RC-19-411

725361

9090423

All lengths and depths are in metres; Grades are in grams per metric tonne.

The "+" annotation following some of the lengths indicates that this interval is at the bottom of a hole that ended in material above the cutoff, and so the actual length of the interval might be longer.

The yellow highlighting marks intervals where the grade-thickness product is above 5 gram-metres per tonne; these carry the significant majority of the gold mineralization.

All recent holes are drilled vertically with most having a target depth of 120m. True widths of the mineralized intersections are about 90% of the indicated drill length.

The significant intervals for the following holes have not previously been reported
